

Dr. Anna M. Rosenhauer is a post-doctoral fellow in the Affective Neuroscience Laboratory at Kennesaw State University under the direction of Dr. Ebony Glover. She received her PhD in neuroscience from Georgia State University studying the effects of social stress experienced during development. She broadly seeks to understand the biological basis of fear and anxiety and their implications for mental health and is currently investigating the interplay of stress responses, hormones, and PTSD. Anna is particularly interested in how chronic stress shapes the brain during development and is passionate about explaining scientific research in an easy to understand and applicable format for both survivors and clinicians. In her free time, you can find her practicing yoga, drinking coffee, writing in her journal, or playing with her dog.
